Linux Memory Threshold Trouble Shooting Guide

If you run into a lot of memory problems—which I've seen in places with dirty power—you should load the `edac_core` module. This Linux kernel module constantly checks for bad memory. To load it, use the command: `$ sudo modprobe edac_core`. Wait for a while and then check to see if anything shows up when you type in the command:

Troubleshooting with Linux Logs. Troubleshooting is one of the main reasons people create logs. When a problem occurs, you'll want to diagnose it to understand why it happened and what the cause was. An error message or a sequence of events can give you clues to the root cause, indicate how to reproduce the issue, and guide you towards solutions.
