Planktonic foraminifera (Globigerinina) first appear in the Early-Middle Jurassic and by the early Upper Jurassic may be abundant in some sequences – although understanding of their distribution and biostratigraphy is often reduced by lumping them together under the term 'protoglobigerinids.' The stratigraphical use of Jurassic foraminifera is relatively limited, however, owing to the relatively long ranges of many taxa, although the group can be locally important for recognizing ...

One of these groups, the planktonic foraminifera, has a rich fossil record that has been vital to our understanding of the history of Earth's oceans and climate. The name "foraminifera" is derived from the Latin word foramen, which means "opening", referring to the apertures in their shells, or tests. Foraminifera, or forams for short, have amoeba-like bodies within tests that are generally made of calcium carbonate.

Further, it has been suggested that some Jurassic fossil foraminifera may have also independently evolved a planktonic lifestyle, and may be members of Robertinida. [36] A number of forams have unicellular algae as endosymbionts , from diverse lineages such as the green algae , red algae , golden algae , diatoms , and dinoflagellates . [29]
