The smallpox vaccine, introduced by Edward Jenner in 1796, was the first successful vaccine to be developed. He observed that milkmaids who previously had caught cowpox did not catch smallpox and showed that inoculated cowpox protected against inoculated smallpox.

WHO | Smallpox vaccines

The smallpox vaccine was the first vaccine to be developed against a contagious disease. In 1796, the British doctor Edward Jenner demonstrated that an infection with the relatively mild cowpox virus conferred immunity against the deadly smallpox virus. Cowpox served as a natural vaccine until the modern smallpox vaccine emerged in the 19th century. From 1958 to 1977, the World Health Organization conducted a global vaccination campaign that eradicated smallpox, making it the only human disease

Smallpox vaccine - Wikipedia

After smallpox was eliminated from the world, routine vaccination against smallpox among the general public was stopped because it was no longer needed. However, because of concern that variola virus might be used as an agent of bioterrorism, the U.S. government has stockpiled enough smallpox vaccine to vaccinate everyone who would need it if a smallpox outbreak were to occur.

Scars like the smallpox vaccine scar form due to the body's natural healing process. When the skin is injured (like it is with the smallpox vaccine), the body rapidly responds to repair the tissue.

Smallpox Vaccine Scar: Why It Happens

Because smallpox no longer occurs anywhere in the world, the general population is no longer vaccinated against it. The smallpox vaccine is administered in a unique manner. A drop of the vaccine virus (called vaccinia) is placed on the upper arm. The drop is then inoculated into the skin using a two-pronged, stainless steel needle.
