### Welfare Aspects Of Transgenic Animals

Transgenic animals also fulfill increasingly important roles in other fields, like livestock production or in biopharming. In the framework of the European Commission's Biotechnology Programme, a workshop has been organized at Utrecht University (30 October, 1995) with leading experts in the field of animal transgenesis and animal welfare as presenting authors.

Every person who works with transgenic animals should be aware of how to assess their welfare and should act so as to avoid or minimise poor welfare. When a transgenic animal has been developed, details of any effects of the genetic manipulation on the welfare of the animal should be part of the specification available for potential users.

Specific welfare aspects have to be taken into consideration with transgenic animals. They include: the extent of discomfort experienced by the parents during the experimental procedures; the effect of the expression of the transgene (the modified gene inserted) on the created transgenic animal; and the effects on their progeny.

Transgenic technology has been used to produce animals as suitable in vivo systems to study human disease, mammalian gene expression and regulation, as well as finding applications in zootechnology, pharmacology and medicine. The past few years have seen a rapid proliferation in the creation of genetically engineered mice as animal models of human diseases, representing an unique and valuable genetic resource.
